

Clear Identity Verification for new accounts

1. Background

Our current digital identity verification process uses **Prove** as the backend service. **Prove** verifies user identity through possession-based checks (e.g., mobile phone ownership) combined with publicly available data sources. While this provides basic validation, it offers only a **low assurance level** of identity verification, insufficient for sensitive healthcare workflows and regulatory standards.

Following the xxxxxx **merger**, the organization now has access to **Clear** as an enterprise identity verification vendor. **Clear** supports high-assurance, multi-factor identity verification aligned with **IAL2 standards**, which are recognized across healthcare and federal systems for strong identity assurance.

2. Problem/Opportunity

! Problem

- **Low Assurance Level:** Prove's verification is limited to possession-based checks, which can be spoofed or compromised.
- **Security and Compliance Gap:** Current flow does not meet IAL2 or equivalent identity verification requirements for high-risk digital interactions (e.g., access to health records).
- **Inconsistent User Experience:** Users may face verification failures or limited confidence when attempting to prove identity digitally.

Opportunity

- **Upgrade Security Posture:** Replacing **Prove** with **Clear** introduces **IAL2-level verification** (photo ID + biometric match), reducing fraud and improving patient trust.
- **Streamlined Patient Onboarding:** **Clear** provides reusable verified identities that can accelerate login and access flows.
- **Future-Proof Compliance:** Alignment with NIST and federal identity standards supports future integrations with external partners and digital health ecosystems.

3. Proposed Solution

Implement **Clear** as the new backend service for digital identity verification across xxxx digital properties.

4. High-Level System Design

5. Security

 CLEAR Verification Flow — Security Review Checklist

5. Success Metrics

Category	Metric	Target
Security	Identity assurance level	Achieve IAL2 compliance
Verification Accuracy	% of verified users passing first attempt	≥ 95%
Adoption	% of users completing verification via CLEAR vs PROVE baseline	+30% within 3 months
User Satisfaction	Post-verification satisfaction (survey/NPS)	≥ 4.5/5
Operational Efficiency	Manual identity exception volume	↓ 50%

6. Decisions/Memos

 Memo: Terms & Conditions Updates for CLEAR Identity Verification

7. Product Agreement

In Scope:

1. **Replace Prove with Clear as the digital identity verification solution** across all applicable flows, including the web and F&MCW mobile app.
2. **Implement IAL2-level verification** using Clear's Document + Selfie flow.
3. **Ensure secure, standards-based integration** by implementing encrypted session management, secure cookie handoffs, and token exchange mechanisms that align with industry best practices for identity assurance and data protection.
4. **Enable operational readiness** by partnering with the Digital Support team to deliver training, support documentation, and updated Knowledge Center articles that educate both staff and patients about the new verification process.
5. **Plan and execute a successful patient rollout**, ensuring phased deployment, monitoring, and feedback collection to validate performance, usability, and security outcomes.

Out of Scope:

- **Identity Provider Functionality:** Clear will be used **strictly as an identity verification service** for the **new patient creation flow**. It will not function as an identity provider (IdP) for authentication or login within this implementation.
- **Direct EPIC Integration:** Clear will **not** directly integrate with EPIC for patient record creation or updates. Existing **SCIM connector workflows** will remain the authoritative mechanism for matching and provisioning new patient records in EPIC.
- **Broader System Integrations:** Any future use of Clear for other identity, access management, or clinical integration scenarios will be evaluated separately and are **not included** in this project's scope.
